## TIER 1 POSTS

---

### POST 1

**Current title:** What Are Edibles? How to Consume Edibles **URL:** `/what-are-edibles-how-to-consume-edibles-and-more/` **Last modified:** March 2026 **AEO Priority:** ⭐⭐⭐⭐⭐ — Definitional content is what AI engines cite most. This post already has good H2 question structure; it needs answer-first paragraphs and a FAQ block.

**Recommended title:**

> What Are Cannabis Edibles? Types, Dosing, Effects & How to Make Them

**Target AI queries this post should answer:**

- "What are cannabis edibles?"
- "How long do edibles take to kick in?"
- "Why don't edibles work for me?"
- "Can you overdose on cannabis edibles?"
- "Are edibles bad for you?"
- "How do edibles work differently than smoking?"

**H2 restructuring (already mostly question-format — just clean up):**

- ✅ What Are Edibles? — keep, add 2-sentence direct answer immediately after

- ✅ How To Consume Edibles — keep, add answer-first paragraph
- ✅ Dosing of Marijuana Edibles — rewrite as "How Do You Dose Cannabis Edibles?"
- ✅ Effects of Edibles — rewrite as "What Effects Do Cannabis Edibles Produce?"
- ✅ Side Effects from Edibles — keep
- ✅ Can You Overdose on Edibles? — keep, this is a natural AI query
- ✅ Are Edibles Bad for You? — keep
- ✅ How to Make Edibles — keep, add CTA to CCHC course

**FAQ block to add (after main content, before related posts):**

**Q: How long do edibles take to kick in?** Edibles typically take 30 minutes to 2 hours to take effect, depending on your metabolism, whether you've eaten recently, and the type of edible. Oils and tinctures absorb faster than solid foods. This delayed onset is why people accidentally eat too much — they don't feel anything after 45 minutes and take more. Always wait the full 2 hours before deciding a dose didn't work.

**Q: Why don't edibles work for me even though I smoke regularly?** Your tolerance to smoked cannabis doesn't automatically transfer to edibles. Edibles are processed through your liver, which converts THC into a more potent compound (11-hydroxy-THC). Some people's livers process this differently, meaning the same edible can hit one person hard and barely affect another. If edibles consistently don't work for you, try taking them with a fatty meal, which improves absorption significantly.

**Q: How long do edibles last compared to smoking?** Edible effects typically last 4 to 8 hours — sometimes longer at higher doses — compared to 1 to 3 hours for smoked cannabis. This longer duration is one reason many medical users prefer edibles, especially for sleep or sustained pain relief.

**Q: What's the right starting dose for someone new to edibles?** If you've never had edibles before, start with 5mg THC or less. Wait the full 2 hours before deciding whether it's working. If you feel nothing, try 5–10mg next time. Going slowly avoids the most common mistake beginners make: eating a second dose too soon and ending up far more medicated than intended.

**Q: Can you make edibles with any cannabis strain?** Yes — any cannabis flower, concentrate, or infusion can be used in edibles. The strain will affect the flavor of your infused butter or oil slightly, but the cooking process mostly neutralizes strain-specific taste differences. What matters more for edibles is the THC and CBD percentages in your starting material, since those determine the final dose.

**Q: What's the difference between cannabis-infused butter and cannabis oil for edibles?** Both work for most recipes. Cannabutter works better in baked goods where butter is traditional (cookies, brownies). Cannabis-infused coconut oil or olive oil is more versatile for savory cooking

and works well anywhere you'd use oil. The cannabinoids bind to fat in either case, so the infusion process and potency math is essentially the same.

---

**POST 2**

**Current title:** 3 Steps to Dosing Homemade Edibles: FREE Email Course **URL:** `/dosing-homemade-edibles/` **Last modified:** September 2024 **AEO Priority:** ⭐⭐⭐⭐⭐ — "How to dose homemade edibles" is one of the highest-intent cannabis searches. However, this post is currently thin — it's mostly a sign-up pitch, not a content post. It needs real content added before AEO optimization will help.

**Recommended title:**

> How to Dose Homemade Edibles: A Step-by-Step Guide

**Target AI queries:**

- "How do I calculate the dose in homemade edibles?"
- "How do you figure out how strong homemade edibles are?"
- "How many mg is in my homemade brownie?"
- "Why are my homemade edibles inconsistent?"
- "How do I dose edibles without a lab test?"

**Content gap — add before FAQ:** This post needs 400–600 words of actual dosing content before the FAQ block and CTA. Suggest adding:

- The basic dosing formula: `(grams of cannabis × THC% × 1000) ÷ servings = mg per serving`
- Why the formula is harder in practice (unlabeled cannabis, decarb variables)
- The 3-step overview (from the email course summary, not the full course)
- A note that the free email course goes deeper

**H2 structure to add/replace:**

- H2: "How Do You Calculate the Dose in Homemade Edibles?"
- H2: "Why Are Homemade Edibles So Hard to Dose Consistently?"
- H2: "The 3-Step Framework for Reliable Dosing"
- H2: "What If My Cannabis Isn't Lab-Tested?"

**FAQ block to add:**

**Q: How do you calculate milligrams of THC in homemade edibles?** The basic formula is: (grams of cannabis × THC% as a decimal × 1000) ÷ number of servings = mg THC per serving. For example, 7 grams of 15% THC cannabis contains about 1,050mg THC total. If your recipe makes 24 brownies, each brownie has roughly 43mg — higher than most beginners want. This is why knowing your starting potency and planning your batch size together is so important.

**Q: What if I don't know the THC percentage of my cannabis?** If your cannabis is unlabeled, you can make a reasonable estimate. Typical street cannabis ranges from 10–20% THC. Using 15% as a conservative estimate is a safe starting point. If you bought from a dispensary, the percentage should be on the label. Our Cannabis Dosing Mastery course covers how to estimate potency in unlabeled cannabis more accurately.

**Q: Why are my homemade edibles inconsistent batch to batch?** Inconsistency usually comes from one of three sources: different cannabis potency between batches, inconsistent decarboxylation (which converts THCa to active THC), or uneven mixing of your infused butter or oil into the recipe. Even distribution is a particular problem with fats — if your cannabutter isn't thoroughly mixed into the batter before baking, some pieces will be stronger than others.

**Q: How do I make edibles that are a consistent 10mg per serving?** Start by calculating the total THC in your batch using the formula above, then work backward to determine how much cannabutter or oil to use to hit your target per-serving dose. If the full amount of infused butter makes pieces too strong, substitute regular butter for part of it. Our dosing calculator app does this math automatically and handles all the variables.

**Q: Is there an easier way to dose homemade edibles without doing all the math manually?** Yes — the Cannademy Dosing Calculator App ($5) does all the calculations instantly. You enter your cannabis amount, THC percentage, and recipe details, and it tells you exactly how much infused butter or oil to use and what each serving will contain. It works for any recipe and any type of cannabis.

**Schema:** FAQ schema, Article schema **Conversion CTA:** Dosing calculator app ($5) + Free email course sign-up + Cannabis Dosing Mastery ($39)

---

**POST 3**

**Current title:** 3 Ways for How to Make Edibles Work Better **URL:** `/how-to-make-edibles-work-better/` **Last modified:** September 2024 **AEO Priority:** ⭐⭐⭐⭐⭐ — "Why don't my edibles work" and "how to make edibles stronger" are extremely common searches. Strong FAQ potential.

**Recommended title:**

> Why Don't Edibles Work for Me? 5 Ways to Make Edibles Work Better

**Target AI queries:**

- "Why don't edibles work for me?"
- "How do I make edibles stronger?"
- "Why do I need so much edibles to feel anything?"
- "Does eating affect edibles?"
- "Why do edibles work for some people and not others?"

**H2 restructuring:**

- H2: "Why Edibles Don't Work the Same for Everyone"
- H2: "Does Eating Before Taking Edibles Make Them Stronger?"
- H2: "Why Do Edibles Work Better With Fatty Foods?"
- H2: "Does Your Liver Affect How Edibles Work?"
- H2: "How to Increase Edibles Effectiveness Without Increasing Dose"

**FAQ block to add:**

**Q: Why do edibles work for some people but not others?** Individual differences in metabolism and liver enzyme activity are the main reason. Edibles are processed through your liver, which converts THC into 11-hydroxy-THC — a compound that's actually more potent and longer-lasting than inhaled THC. Some people's livers produce this conversion efficiently; others don't. This is genetic and there's no way to "train" it. If edibles consistently don't affect you even at high doses, this liver enzyme variation may be the reason.

**Q: Does eating food before taking edibles make them work better or worse?** Eating a meal with healthy fats (avocado, nuts, olive oil, full-fat dairy) before or alongside edibles can significantly improve absorption — some studies show up to 4x better absorption with a fatty meal. An empty stomach can sometimes make onset faster but less consistent. The worst scenario is taking edibles right after a heavy meal of processed foods, which may slow absorption unpredictably.

**Q: How long should I wait before deciding my edible dose didn't work?** Always wait at least 2 hours, preferably 2.5. The most common mistake is taking a second dose at the 45-minute or 1-hour mark when nothing's happened yet — only to have both doses hit at once an hour later. Factors like meal timing, individual metabolism, and the specific edible type all affect onset timing. When in doubt, wait it out.

**Q: Can I increase how well edibles work by changing what I eat with them?** Yes. Taking edibles alongside foods high in healthy fats — avocado, full-fat yogurt, nuts, coconut oil — improves THC absorption because cannabinoids are fat-soluble. Some people also report that medium-chain

triglycerides (MCT oil) are particularly effective. This is why cannabis-infused coconut oil is so popular — the MCT content may improve bioavailability on its own.

**Q: Does building tolerance to smoking affect how edibles work?** Somewhat, but the relationship isn't direct. Edibles produce a different metabolite (11-hydroxy-THC) than inhaled cannabis, so your smoking tolerance doesn't fully transfer. Frequent edible users can build edible-specific tolerance. Taking a 2–3 day tolerance break often restores edible sensitivity significantly.

**Schema:** FAQ schema, Article schema, HowTo schema (for the "5 ways" section) **Conversion CTA:** Cannabis Dosing Mastery + dosing calculator app

---

**POST 4**

**Current title:** The 1 Thing MOST People Get Wrong About Edibles Tolerance **URL:** `/edibles-tolerance/` **Last modified:** September 2024 **AEO Priority:** ⭐⭐⭐⭐ — Good clickbait title, but the question-phrasing in the title doesn't align with how people search. The FAQ block will do the heavy lifting for AEO here.

**Recommended title:**

> Cannabis Edibles Tolerance: Why It's Different From Smoking (And How to Reset It)

**Target AI queries:**

- "How does cannabis edibles tolerance work?"
- "Why do I need more edibles to feel the same effect?"
- "How do you reset cannabis tolerance?"
- "Does edibles tolerance transfer to smoking?"
- "How long does it take to lower edibles tolerance?"

**H2 restructuring:**

- H2: "Why Edibles Tolerance Is Different from Smoking Tolerance"
- H2: "How Does Edibles Tolerance Build Over Time?"
- H2: "What's the Most Common Mistake With Edibles Tolerance?"
- H2: "How to Lower Your Edibles Tolerance (Tolerance Break Guide)"
- H2: "Does a Smoking Tolerance Break Help With Edibles?"

**FAQ block to add:**

**Q: How does cannabis edibles tolerance work?** When you consume edibles regularly, your endocannabinoid receptors (primarily CB1 receptors) gradually downregulate — meaning they become less responsive to THC. This happens with both smoked and edible cannabis, but the metabolite produced by edibles (11-hydroxy-THC) creates a somewhat different tolerance pattern than inhaled THC. The result is that you need more over time to feel the same effect.

**Q: Does smoking tolerance transfer to edibles?** Partially, but not completely. Because edibles produce a different primary compound than smoked cannabis, you can have a high smoking tolerance and still be significantly affected by edibles — and vice versa. Many experienced smokers are surprised by how strongly edibles hit them even after years of regular cannabis use.

**Q: How long does a tolerance break take to work for edibles?** Most people notice meaningful sensitivity improvement after just 2–3 days without cannabis. A full 2-week break typically restores close to baseline sensitivity. Even a single day off can have a noticeable effect. The key is consistency — breaking for 3 days every week has more cumulative impact than taking one big break every few months.

**Q: What's the fastest way to reset edibles tolerance?** A complete cannabinoid abstinence break is the only reliable method — no flower, no edibles, no concentrates. Some people find that CBD alone (without THC) during a tolerance break doesn't interfere with the reset process, but the evidence is anecdotal. Exercise and good sleep support the endocannabinoid system generally, which may help sensitivity return faster during a break.

**Q: Can you microdose edibles to avoid building tolerance?** Yes — microdosing (typically 2.5–5mg THC) is often cited as a way to get therapeutic benefits while minimizing tolerance buildup. The theory is that lower doses may not downregulate CB1 receptors as aggressively as full doses. Many medical users prefer microdosing for exactly this reason, combining low-dose edibles with occasional higher-dose use when needed.

---

**POST 5**

**Current title:** How NOT to Waste Money When Making Edibles **URL:** `/waste-money-making-edibles/` **Last modified:** September 2024 **AEO Priority:** ⭐⭐⭐⭐ — Problem-solving posts get strong AI citation. "How to make edibles without wasting cannabis" is a genuine beginner pain point.

**Recommended title:**

> How to Make Edibles Without Wasting Cannabis (7 Money-Saving Tips)

**Target AI queries:**

- "How do I avoid wasting cannabis when making edibles?"
- "Why are my homemade edibles weak?"
- "What's the most common mistake making edibles?"
- "How do I get the most THC out of my edibles?"
- "Do you have to decarboxylate cannabis before making edibles?"

**H2 restructuring:**

- H2: "Why Do Homemade Edibles So Often Come Out Weak?"
- H2: "What Is Decarboxylation and Why Does It Matter?"
- H2: "How Much Cannabis Should You Use for Edibles?"
- H2: "Does the Temperature You Cook at Destroy THC?"
- H2: "How to Store Cannabis Infusions Without Losing Potency"
- H2: "7 Ways to Stop Wasting Cannabis When Making Edibles"

**FAQ block to add:**

**Q: Why are my homemade edibles so weak even when I use a lot of cannabis?** The most common culprit is skipping or rushing decarboxylation. Raw cannabis contains THCa, which is non-intoxicating. Heat converts it to THC during decarboxylation. If your cannabis wasn't properly decarbed before infusion, you may have lost 50% or more of your potential potency before you even started cooking. Other causes: too-high cooking temperature during infusion, which destroys THC, or not enough fat in the recipe to carry the cannabinoids.

**Q: Does cooking temperature destroy THC in edibles?** Yes — excessive heat degrades THC. THC begins to break down above about 245°F (118°C). However, the internal temperature of most baked goods stays well below this, even when your oven is set to 350°F or higher. The edible itself doesn't reach oven temperature. The danger zone is extended cooking at high heat, or overheating your infused butter/oil during the infusion process.

**Q: How long should you decarboxylate cannabis for edibles?** The most common recommendation is 240–245°F for 40–60 minutes in a conventional oven. Times vary based on your oven's accuracy, moisture content of your cannabis, and desired activation level. Some people use lower temperatures (220°F) for longer times (90 minutes) to preserve more terpenes. An oven thermometer is worth it — most home ovens run 15–25°F off from their dial setting.

**Q: How do you prevent uneven dosing in homemade edibles?** Thorough mixing is critical. Your infused butter or oil must be completely homogenized throughout the batter or dough before baking. For brownies and bar cookies, also mix the batter extensively after adding the fat. For cookies, let chilled dough come to room temperature for more even consistency. Cutting your finished product into uniform pieces also makes a big difference in portion consistency.

**Q: Is it more efficient to use less cannabis and infuse a smaller amount of butter?** Generally yes — a higher cannabis-to-butter ratio typically leads to better extraction efficiency than a very dilute infusion. Using 1 oz of cannabis per 1 cup of butter extracts more efficiently than using the same ounce in 4 cups of butter, because the infusion saturation point affects how much THC actually binds. However, you'll need less infused butter per recipe, so calculate accordingly.

---

**POST 6**

**Current title:** 5 Reasons Why an Edibles Dosage Calculator is Important **URL:** `/edibles-dosage-calculator/` **Last modified:** March 2026 **AEO Priority:** ⭐⭐⭐⭐ — Commercial intent post. AI engines can cite this when someone asks "what is a cannabis dosing calculator" or "how do I calculate edibles dose." Recently updated, so structure improvements have more immediate impact.

**Recommended title:**

> Cannabis Edibles Dosage Calculator: Why You Need One and How It Works

**Target AI queries:**

- "What is a cannabis edibles dosage calculator?"
- "How do you calculate THC in homemade edibles?"
- "Is there an app for calculating cannabis edibles?"
- "How do I know how many mg are in my edibles?"

**H2 restructuring:**

- H2: "What Is a Cannabis Edibles Dosage Calculator?"
- H2: "Can't I Just Do the Math Myself?"
- H2: "What Does the Calculator Account For?"
- H2: "How Accurate Are Cannabis Dosage Calculators?"
- H2: "How Do I Use the Cannademy Dosing Calculator?"

**FAQ block to add:**

**Q: What does a cannabis edibles dosage calculator do?** A cannabis dosage calculator takes your starting inputs — the weight of cannabis you're using, its THC or CBD percentage, the amount of butter or oil in your recipe, and how many servings your recipe makes — and calculates the

milligrams of THC or CBD per serving. It handles the math that accounts for the infusion process, so you know exactly how potent each piece of your finished edible will be.

**Q: How accurate is a cannabis dosage calculator?** The calculator is only as accurate as your inputs. If your cannabis was lab-tested, the results will be quite precise. If you're estimating the THC percentage (common with unlabeled cannabis), the calculator gives you a best estimate based on the percentage you enter. Even with estimated inputs, a calculator gives you a far better picture than guessing, and it prevents the most common mistake: accidentally making edibles much stronger than intended.

**Q: Does the calculator work for CBD edibles?** Yes — the same calculation principles apply to CBD. You enter the CBD percentage of your starting material, and the calculator determines CBD per serving. Many people use a combination of THC and CBD in their edibles, and a good calculator handles both separately so you can see the ratio in each piece.

**Q: Does a dosage calculator work with concentrates like RSO or FECO?** It depends on the calculator. Basic calculators are built for flower only. The Cannademy dosing calculator handles concentrates including RSO, FECO, kief, and distillates, which have very different potencies and require different calculation methods than flower-based infusions.

### POST 7

**Current title:** DIY Cannabis Cookbook: Add weed to ANY Recipe **URL:** `/diy-cannabis-cookbook/` **Last modified:** September 2024 **AEO Priority:** ⭐⭐⭐⭐ — "How to add cannabis to recipes" and "how to make any recipe into an edible" are strong AI-answerable questions. Good content opportunity.

**Recommended title:**

> How to Add Cannabis to Any Recipe: DIY Cannabis Cooking Guide

**Target AI queries:**

- "How do I add cannabis to a recipe?"
- "Can you put cannabis in any recipe?"
- "How do you substitute cannabutter in recipes?"
- "Can you cook with cannabis flower directly?"

- "What's the easiest way to infuse cannabis into food?"

**H2 restructuring:**

- H2: "Can You Add Cannabis to Any Recipe?"
- H2: "How Do You Substitute Cannabutter or Cannabis Oil in a Recipe?"
- H2: "What's the Easiest Way to Start Cooking With Cannabis?"
- H2: "Does Cooking Destroy the THC in Your Edibles?"
- H2: "How Do You Control the Dose When Adapting Recipes?"

**FAQ block to add:**

**Q: Can you really add cannabis to any recipe?** Almost any recipe can be made into an edible by substituting cannabutter for regular butter, or cannabis-infused oil for regular oil. The main limitation is that some savory dishes can develop a noticeable cannabis flavor, particularly with strongly flavored infusions. Baked goods, sauces, and dishes with bold flavors mask this best. Recipes that call for no fat at all are the hardest to adapt.

**Q: How do you substitute cannabutter in a regular recipe?** Substitute cannabutter 1:1 for regular butter in most recipes. Because cannabutter is often quite potent, many people substitute only a portion — for example, half cannabutter and half regular butter — to control the dose per serving. The Cannabis Dosing Mastery course covers exactly how to calculate the right ratio for your target dose.

**Q: Can you cook directly with cannabis flower instead of making infusions first?** Technically yes, but it's not recommended for most uses. Raw cannabis must be decarboxylated first to activate THC. Even after decarb, the plant material doesn't distribute evenly through a recipe and creates an unpleasant texture. Making a proper infusion first — cannabutter, cannabis oil, or cannabis cream — gives you far more control over dosing and a much better final product.

**Q: What's the simplest cannabis recipe for a beginner to start with?** Rice Krispie treats are the classic beginner choice — no baking required, just melt cannabutter with marshmallows and cereal. If you can melt butter, you can make them. Brownies from a boxed mix with cannabutter substituted are the next easiest step up. Both are very forgiving of imprecise timing, which baking often is not.

**POST 8**

**Current title:** Long Term Cannabis Benefits: Why You Need Cannabis NOW **URL:** `/long-term-cannabis-benefits/` **Last modified:** March 2026 **AEO Priority:** ⭐⭐⭐ —

Informational/research content. AI engines cite this type of post for health-adjacent queries, but "benefits" content gets scrutinized for claims. Keep language measured.

**Recommended title:**

> Long-Term Cannabis Benefits: What Research Shows About Extended Use

**Target AI queries:**

- "What are the long-term benefits of cannabis?"
- "Is cannabis good for you long-term?"
- "Does cannabis use have health benefits over time?"
- "What conditions does cannabis help with long-term?"

**Key note:** This post requires care with claim language. Use "research suggests" and "some users report" rather than definitive health claims. Add a disclaimer that cannabis is not a substitute for medical advice.

**H2 restructuring:**

- H2: "What Does Research Show About Long-Term Cannabis Use?"
- H2: "Which Conditions May Benefit from Regular Cannabis Use?"
- H2: "Is Daily Cannabis Use Harmful or Beneficial?"
- H2: "What's the Difference Between THC and CBD Long-Term Benefits?"

**FAQ block to add:**

**Q: Are there documented long-term benefits of cannabis use?** Research on long-term cannabis benefits is ongoing and complex. Studies suggest regular cannabis use may support pain management, sleep quality, and anxiety relief for some people. However, results vary by individual, method of consumption, and frequency of use. Edibles and non-smoked forms are generally considered preferable for long-term use since they avoid the respiratory effects of smoking. Always consult a healthcare provider about using cannabis for specific medical conditions.

**Q: Is cannabis use safe long-term?** Long-term safety depends heavily on how you consume cannabis. Smoking carries similar respiratory risks to tobacco. Edibles and tinctures avoid combustion entirely, making them the preferred option for regular users. Most research suggests moderate edibles use by adults poses limited health risks, though anyone with a personal or family history of psychosis, heart conditions, or using certain medications should speak with a doctor first.

**Q: Does CBD have different long-term benefits than THC?** CBD is being studied for anti-inflammatory, neuroprotective, and anxiety-reducing properties without the intoxicating effects

of THC. THC offers stronger pain relief and sleep support but comes with the high. Many long-term users find a combination works best — higher CBD during the day and THC-forward formulations at night. The Cannademy Cannabis Cooking for Home Cooks course includes a full module on cooking with CBD.

**Recommended title:**

> Who Should (and Shouldn't) Use Cannabis Topicals? A Practical Guide

**Target AI queries:**

- "Do cannabis topicals get you high?"
- "Who can benefit from cannabis topicals?"
- "What conditions do cannabis topicals help with?"
- "Can anyone use cannabis topicals?"
- "Are cannabis topicals safe?"

**H2 restructuring:**

- H2: "What Are Cannabis Topicals and How Do They Work?"
- H2: "Do Cannabis Topicals Get You High?"
- H2: "Who Benefits Most from Cannabis Topicals?"
- H2: "Who Should Avoid Cannabis Topicals?"
- H2: "Can You Make Cannabis Topicals at Home?"

**FAQ block to add:**

**Q: Do cannabis topicals get you high?** No — standard cannabis topicals (creams, salves, balms) don't produce any intoxicating effects. When applied to skin, the cannabinoids absorb locally but don't enter the bloodstream at levels that affect the brain. The one exception is transdermal cannabis patches, which are specifically designed for systemic absorption and can produce noticeable effects. For everyday topical use, there's no high.

**Q: What conditions are cannabis topicals most commonly used for?** Cannabis topicals are most commonly used for localized pain (joint pain, muscle soreness, arthritis), skin conditions (psoriasis, eczema), inflammation, and post-workout recovery. Many users also report benefits for minor burns, dry skin, and tension headaches when applied to temples. Effects are localized to the area of application.

**Q: Who should avoid cannabis topicals?** People with known sensitivity to cannabis or any carrier ingredient in the specific product (coconut oil, shea butter, essential oils) should patch test first. Broken skin or open wounds should generally be avoided. People subject to drug testing should be cautious — while most standard topicals don't cause failed drug tests, transdermal patches that deliver cannabinoids into the bloodstream might. Anyone on blood thinners or other medications should check with a pharmacist.

**Q: Can you make cannabis topicals at home?** Yes — homemade cannabis topicals are simpler to make than edibles and don't require precise dosing since they're not ingested. A basic cannabis salve requires only infused coconut oil, beeswax, and any additional essential oils you choose. Cannademy's Easy DIY Marijuana Skincare and Topicals course covers multiple topical recipes and formulations in depth.

**Current title:** Why Marijuana Classes Online Are Better Than Cannabis Universities **URL:** `/why-marijuana-classes-online-are-better-than-cannabis-universities/` **Last modified:** September 2024 **AEO Priority:** ⭐⭐

**Recommended title:**

> Online Cannabis Education vs. Cannabis Universities: Which Is Better for Home Cooks?

**Target AI queries:**

- "Best online cannabis cooking courses"
- "Cannabis university vs online courses"
- "Where can I learn cannabis cooking online?"

**FAQ block to add (3 questions sufficient):**

**Q: What's the difference between a cannabis university and online cannabis classes?** Cannabis universities (also called cannabis colleges) typically focus on industry roles — cultivation, retail, compliance, lab work. They're designed for people entering the cannabis business professionally. Online cannabis cooking classes like Cannademy are designed for home cooks who want to medicate better at home, not enter the cannabis industry. The curriculum, cost, and time commitment are completely different.

**Q: Do you need formal education to learn cannabis cooking?** No — cannabis cooking is a skill anyone can learn at home with the right instruction. You don't need culinary school, a cannabis certificate, or an industry background. The techniques are approachable with basic kitchen equipment and a willingness to learn proper infusion and dosing methods.

**Q: Is online cannabis education as good as in-person classes?** For home cooks, online is actually better in most cases. You can pause, rewatch, and practice at your own pace in your own kitchen with your own equipment. In-person classes are great for networking, but for practical skill-building, the ability to watch a technique multiple times and practice immediately afterward makes online learning highly effective.

> Who Actually Uses Cannabis? Breaking Down Common Stereotypes

---

**POST 12**

**Current title:** 7 Ways Professional Cannabis Chefs Can Increase Their Income **URL:** `/professional-cannabis-chef/` **Last modified:** September 2024 **AEO Priority:** ⭐⭐ — This post targets professional chefs, not home cooks. It's off-brand for Cannademy's core audience. Consider whether to keep, redirect, or reframe it.

**Option A — Reframe for home cooks:**

> From Home Cook to Cannabis Chef: Can You Turn Your Edibles Hobby Into Income?

**Option B — Keep for long-tail professional searches, add FAQ:**

**FAQ block (abbreviated — 3 questions):**

**Q: How do professional cannabis chefs make money?** Professional cannabis chefs generate income through private chef services, catering events (where legal), teaching classes, developing recipes for cannabis brands, consulting for cannabis companies, and creating online content or courses. The cannabis culinary industry is growing rapidly as legalization expands.

**Q: Do you need culinary training to become a cannabis chef?** Formal culinary training helps but isn't strictly required. What matters more is understanding cannabis-specific techniques — proper decarboxylation, infusion methods, dosing — combined with solid cooking fundamentals. Many successful cannabis chefs are self-taught home cooks who developed expertise through practice and study.

**Schema:** FAQ schema, Article schema **Conversion CTA:** Cannademy courses (particularly if reframed for home-cook-to-professional path)

---

**POST 13**

**Current title:** Why are Professional Chefs Going to Cannabis Cooking School? **URL:** `/chefs-cannabis-cooking-school/` **Last modified:** September 2024 **AEO Priority:** ⭐⭐ — Similar audience mismatch as Post 12. Same consideration applies.

**Recommended title:**

> Why Chefs Are Learning Cannabis Cooking (And What Home Cooks Can Learn Too)

**FAQ block (abbreviated):**

**Q: Why are professional chefs interested in cannabis cooking?** As cannabis legalization expands, chefs see growing demand for cannabis-infused catering, private dining, and product development. Cannabis cooking also requires genuinely new techniques — dosing, decarboxylation, infusion chemistry — that aren't covered in culinary school. Chefs who learn these skills early position themselves for a growing market.

**Q: Is cannabis cooking useful for regular home cooks, not just professionals?** Absolutely — the techniques are the same. The main difference is scale and setting. Everything a professional cannabis chef learns about proper infusion and dosing applies directly to making better edibles at home. Cannademy's courses are specifically designed for home cooks, not industry professionals.

---

**POST 14**

**Current title:** Cannabis Certificates From Cannademy **URL:** `/cannabis-certificates-from-cannademy/` **Last modified:** September 2024 **AEO Priority:** ⭐ — Primarily a promotional/credential page. Low AEO opportunity, but add basic FAQ and update for freshness.

**FAQ block (abbreviated):**

**Q: Does Cannademy offer cannabis certificates?** Yes — Cannademy issues completion certificates for each course. While these aren't industry licensing credentials, they document your training and knowledge in cannabis cooking, dosing, and related topics.

**Q: Are Cannademy certificates recognized in the cannabis industry?** Cannademy certificates document course completion and skill development. They're most valuable as personal credentialing for home cooks and enthusiasts. For formal cannabis industry roles, regulatory licensing requirements vary by state and are separate from educational certificates.

---

## Implementation Checklist (Post-by-Post)

For each post, work through these steps in order:

### Step 1 — Byline & Date

- [ ] Change author to "Cheri Sicard, Cannabis Author & Educator"
- [ ] Update Last Modified date
- [ ] Update "Updated [Month Year]" note at top of post

### Step 2 — Title & Meta

- [ ] Update post title in WordPress
- [ ] Update Rank Math meta description (150–155 characters, question or benefit focused)

### Step 3 — Content Structure

- [ ] Add answer-first paragraph after each H2
- [ ] Convert declarative H2s to question format
- [ ] Break up any paragraphs longer than 4 lines

### Step 4 — FAQ Block

- [ ] Add FAQ section before Related Posts
- [ ] Enable FAQ schema in Rank Math per-post toggle

### Step 5 — Internal Links

- [ ] Add link to at least one Cannademy course

- [ ] Add link to at least one related post (cannademy.com or cannabischeri.com)
- [ ] Add link to dosing calculator where relevant

**Step 6 — Schema**

- [ ] Verify Article schema is active (dateModified included)
- [ ] FAQ schema enabled
- [ ] HowTo schema added where applicable (Code Snippets)

**Step 7 — Publish**

- [ ] Save, preview, publish
- [ ] Request re-index via Google Search Console
